APPLICATIONS

Mati is an advanced management system designed specifically for industrial laundries. Mati's control of the production process starts with the receipt of wet and clean linen and ends with the automatic application of the labels to the individual packs made up. The Mati database consists of the complete laundry register (clients-items) and all the technical parameters required by the pressing section processes. A panel PC network, installed at each workstation, connected to the central control unit computer manages and controls all this data flow. This central control unit is in turn connected to the laundry's computer system. Mati is not designed for statistical purposes, but is a real process control which, in addition to identifying the product, follows it through all the processing stages. Above all, it automates the programming of the whole process.

the pressing-folding department. In addition to the accounting for invoicing, the information provided by Mati allows all kinds of analysis in real time. Mati smart cards used by operators, with analytical recording of person-hours, allow calculation of actual production efficiency of the lines. Mati's flexibility helps to provide solutions to different management types, by item, by client, etc.
