

APPLICATIONS

Teren is a system for automatically collecting folded linen and direct supplying it to the wrapping machine.

CONFIGURATIONS

Due to maximum flexibility in combining the basic elements, configurations can be customised to meet your clients' needs.

It optimises the installation of your laundry equipment because it requires less space and manpower.

FEATURES

The special unloading device comes into operation automatically, at variable speeds, and is equipped with everything necessary for handling unpacked folded bundles of laundry.

Only electrical equipment is used for all movements.

The height from the floor is 520 mm. Access to the machines is ensured by special ladders fitted with the necessary safety equipment.

An easy-to-program control unit manages the entire system.

It can be combined with the Mati ® production monitoring and control system.
